Use Case : Place Order and Receive Confirmation

Use Case	Case Name	
Goal	The customer adds products to the shopping cart, proceeds to checkout, and successfully places an order. The system processes the payment and generates an order confirmation.	
Preconditions	Customer is logged into the system and has at least one product in the shopping cart.	
Success End Condition	Order is placed successfully, payment is processed, and the customer receives an order confirmation notification.	
Failed End Condition	The order could not be placed due to payment failure, insufficient stock, or a system error.	
Primary Actors	Customer, Payment Gateway	
Trigger	Customer clicks the "Place Order" / "Checkout" button.	
Description / Main Success Scenario	Step	Action
	1	Customer reviews the items in the shopping cart.
	2	Customer clicks the "Checkout" button.
	3	System displays the order summary with total price and delivery details.
	4	Customer enters payment details and clicks "Place Order".
	5	System sends payment information to the Payment Gateway for processing.
	6	Payment Gateway confirms the payment and the system generates an order confirmation and notifies the customer.
Alternative Flows	Step	Branching Action
	4a.	Payment details are invalid System displays an error and prompts the customer to re-enter payment information.
	5a.	Payment Gateway declines the payment System notifies the customer that the payment was unsuccessful and the order is not placed.
	5b.	One or more items in the cart are out of stock — System notifies the customer and cancels those items from the order.
